

Abstract of the Disclosure

An attachment to any book that allows for a portable writing platform for note taking or holding additional reading material for either right or left handed users. This attachment is attached to a book utilizing the front or back cover of the book as the method for attachment. A preferred embodiment includes two parallel rigid surfaces separated in some fashion by a divider which could be located at the top of the apparatus. This divider creates a channel for a third rigid surface to slide in and out between the two parallel rigid surfaces. This third rigid surface acts as the writing surface. This third surface incorporates a channel for guiding this surface out away from the book while attached to create the writing surface. When not in use this third surface is pushed back in between the other two surfaces into a closed position for use as a bookmark.
